

ABSTRACT OF THE DISCLOSURE

An adjustable Hanging Sports Equipment holder, to be utilized for the home, retail display and in gymnasiums, can be advantageously hung from a wall or a ceiling by a hanging device. Formed from a durable yet formable material, comprising of a plurality of openings on the body of the apparatus to insert and retain sports equipment. The said invention exhibits the ability to be shortened and lengthened according to the user's desire and available hanging space. The elongated tubular embodiment advantageously allows multiple sports balls to be stored and retrieved by utilizing the top and bottom elasticized openings as the sports equipment is inserted into the adjustable hanging apparatus. A preferred embodiment includes a means for supporting basketballs, soccer balls and the like, also a means for an air pump holder as well as one or more pockets for storage of ball needles, valves and pins.
